Data Dictionary
Manchester-based Clinical-Functional Classification of Emergency Department Presenting Complaints
(EDEN-RICAPPS project)

Overview

This document describes the variables included in the dataset `classification_manchester_ed_presenting_complaints.xlsx`.

The dataset provides a clinical-functional classification of emergency department presenting complaints inspired by the Manchester Triage System and developed as a methodological output of the EDEN-RICAPPS project.

The dataset does **not** contain patient-level data and does **not** include clinical outcomes.

Variables

1. diagnostic_code

- **Type:** String
- **Description:**
  Diagnostic or presenting-complaint code provided by the user.
  This field is intentionally left flexible to allow mapping from different coding systems (e.g., ICD-9-CM, ICD-10-ES, local or institution-specific codes).
- **Values:**
  Free text or alphanumeric code defined by the user.
- **Notes:**
  This variable is not populated in the reference dataset and must be completed by users when applying the classification to their own data.

---

2. manchester_id

- **Type:** Integer
- **Description:**
  Numeric identifier of the Manchester-inspired clinical-functional chapter.
- **Values:**
  `1` – Cardiorespiratory
  `2` – Acute neurological
  `3` – Sepsis / potential infection
  `4` – Medical–surgical abdominal
  `5` – Major trauma
  `6` – Debility and fatigue

`7` – Initial low vital risk
`8` – Other complaints
- **Notes:**
Each diagnostic code must be assigned to **one and only one**
`manchester_id`.

---

3. manchester_label

- **Type:** String
- **Description:**
Descriptive label corresponding to the clinical-functional chapter defined by
`manchester_id`.
- **Values:**
- *Cardiorespiratory*
- *Acute neurological*
- *Sepsis / potential infection*
- *Medical–surgical abdominal*
- *Major trauma*
- *Debility and fatigue*
- *Initial low vital risk*
- *Other complaints*
- **Notes:**
Provided for human readability and interpretability.
The analytical identifier is `manchester_id`.

General Notes

- The classification is **clinical-functional** and oriented toward **early risk stratification**, not final diagnosis.
- The category *“Debility and fatigue”* is defined in the conceptual framework even if it may be empty in some cohorts, reflecting common clinical coding practices.
- The dataset is designed to be reusable across institutions and studies without requiring proprietary software.
